

What to do in case the Mac with just:connect becomes unavailable?

Georg - 2023-02-06 - just:live/play

The mac running just:connect became unavailable and another mac has to be configured to take over. Here is how this can be done.

1. Copy the backup channel file (or the original channel file in case you did not use our backup function) to the other mac where you want to use just:connect temporarily.
2. Place it under Macintosh HD HD/Library/Application Support/Toolsonair/Just Connect
3. In Case the "Just Connect" Folder does not exist create one and place the channel file inside
4. Right Mouse click on channel file -> show package content
5. Open config.json file and change the "engine-IP" to the IP where you will run the "new just connect"
6. Save and close
7. Open just connect (in case you had just:connect open before please restart it)
8. Go to just control and add a new device with the IP from the new just connect machine
9. Done!
